Material of gloves

The selection of the suitable gloves does not only depend on the material, but also on further marks of quality and varies from manufacturer to manufacturer. As the product is a preparation of several substances, the resistance of the glove material can not be calculated in advance and has therefore to be checked prior to the application.

Penetration time of glove material

The exact break through time has to be found out by the manufacturer of the protective gloves and has to be observed.

12.6 Other adverse effects

The phytotoxicity was evaluated according to the OECD Guideline for Testing of Chemicals 208 Terrestrial Plant Test: Seedling Emergence and Seedling Growth Test (2006). Three plant types were evaluated: barley (*Hordeum vulgare*), cress (*Lepidium sativum*) and radish (*Raphanus sativus*).

The addition of 0.2% on dry weight to soil had no negative effect on the germination and growth of barley, cress and radish. The germination and plant bio mass yield in the test soil amounted to over 90% of these in the test soil. For barley and radish, no negative effect was observed up to a concentration of 1% and 0.5% respectively.

The NOEC (No Observed Effect Concentration) on 0.2% at dry weight equal an 0.3% concentration on wet weight.
